OM protein - protein search, using sw model

Run on: June 17, 2002, 15:58:26 ; Search time 95.43 Seconds (without alignments) 10.069 Million cell updates/sec

Sequence: Perfect score: US-09-761-636A-13 56 CISVPLSVPC 10

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched: 283138 seqs, 96089334 residues

Total number of hits satisfying chosen parameters: 283138

Minimum DB seg length: Maximum DB seg length: 2000000000

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 45 summaries

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

A;Title: Complete genome sequence of an aerobic hyper-thermophilic Crenarchaeon, Aeropyr A;Rocession: F72751
A;Reference number: A72450; MUID:99310339
A;Accession: F72751
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-100 < KAWD
A;Residues: 1-100 < KAWD
A;Residues: 1-100 < KAWD
A;Residues: 1-100 < KAND
A;Experimental source: strain Kl
C;Genetics:
A;Gene: APE0003
C;Superfamily: Aeropyrum pernix hypothetical protein APE0003
C;Superfamily: Aeropyrum pernix hypothetical protein APE0003
C;Superfamily: Aeropyrum pernix hypothetical protein APE0003

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hormone-related anglogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat achronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retirence to the sequence of the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psociasis, arthropathy, heat or creebrovascular accident, post-angiophasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive beneficially and accident diagraphic allocations of the liver, excessive
                                                                                                                                                                                                                                                                                                                                            neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VEGF based monocyclic peptide 3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neovascularisation or lymphangiogenesis in a mammal with a condition of characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, combination or is diabetic retinopathy, psoriasis, arthropathy, combination is diabetic retinopathy, psoriasis, arthropathy.

CC hemangioma, vascularised malignant or benign tumour, post-recovery combination, substance-induced malignant or benign tumour, post-recovery combined to reduce the constant of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver combination. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid combination in peripheral limbs or in lungs, peritoneal cavity, pleura, cor brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere cuits at least one biological activity induced by VEGF, VEGF-C or D and combination with an anti-inflammatory agent, to treat a combinity retirements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

The PP encoding gene was discovered using the subtraction cloning of cDNA from mRNA obtd. from monozygotic twins discordant for schizophrenia and assaying for clones in which expression is greatest in the 'well' twin. A nt sequence substantially corresp. to AAQ75090 is claimed, which comprises 30-X nts, where X=80, 95, 158, 222, 243, 249, 260, 295, 407 or 423. A PP peptide of 10-141 AAs is also claimed.
                                                                                                            neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.

The comocyclic peptides, dimeric blcyclic peptides (comprising 2 linked comonocyclic peptides) and a cyclic peptide with at least one amino acid comocyclic peptides) and a cyclic peptide with at least one amino acid comocyclic peptides) and a cyclic peptide with at least one amino acid comocyclic peptides in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, companyioma, vascularised malignant or benign tumour, post-recovery companyioma, vascularised neovascularisation of the liver, excessive commone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver companyioma, the peptides are also used to modulate vascular permeability in amammal (the mammal has a condition characterised by fluid companyioma. The peptides are used to modulate vascular permeability carbonic infection. The peptides are used to modulate vascular permeability carbonic train. The peptides are used to interfere companyional permeability pleura, companyional permeability pleura,

                                                                                                                                   Q
                                                                                                                                                                                                                                                                              RESULT · 6
                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                              cerebrovascular accident, post-angioplasty restenosis, head, heat or coltrauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammatory agent, to treat a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring

deleted prior to cyclisation are used to interfere with angiogenesis, concavascularisation or lymphangiogenesis in a mammal with a condition oc characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, chemangioma, vascularised malignant or benign tumour, post-recovery contents, substance-induced neovascularisation of the liver, excessive chromone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver confection. The peptides are also used to modulate vascular permeability care mammal (the mammal has a condition characterised by fluid caccumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic cor brain. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and care also used in combination with an anti-inflammatory agent, to treat a chronic inflammatory agent, to treat a clibabit crefit of the service of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       beta-beta carbon separation distances on opposite antiparallel strands a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclising a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neovascularisation; lymphanglogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring

beta-beta carbon separation distances on opposite antiparallel strands of CC a peptide loop fragment from an exposed loop of a growth factor protein cand cyclising the peptide by oxidising the cysteine residues. The CC and cyclic peptides, dimeric bicyclic peptides (comprising 2 linked cc monocyclic peptides) and a cyclic peptide with at least one amino acid CC deleted prior to cyclisation are used to interfere with angiogenesis, concovascularisation or lymphangiogenesis in a mammal with a condition cc characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy. CC hemangioma, vascularised malignant or benign tumour, post-recovery creamonersular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cc hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver confection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.
accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere
                                                                                                                                                                                                                                                 The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring
                                                                                                                                                                                                                                                                                                                                                      Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclising a peptide loop fragment from an exposed loop of a growth factor protein by
                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2001-442248/47.

                                                                                                                                                                                                                                                                                                                                                       The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be us in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               neovascularisation or lymphanglogenesis in a mammal with a condition.

C characterised by angiogenesis, neovascularisation or lymphanglogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy,

c characterised by angiogenesis, neovascularisation or lymphanglogenesis.

C themangioma, vascularised malignant or benign tumour, post-recovery

C cerebrovascular accident, post-angioplasty restenosis, head, heat or cold

trauma, substance-induced neovascularisation of the liver, excessive

c hormone-related angiogenic dysfunction, diabetes induced neovascular

sequelae, hypertension induced neovascular sequelae, or chronic liver

infection. The peptides are also used to modulate vascular permeability

in a mammal (the mammal has a condition characterised by fluid

c accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura,

or brain. The peptides are used to image blood vessels and lymphatic

vasculature. The monomeric and bicyclic peptides are used to interfere

with at least one biological activity induced by VESF, VESF-C or D and

are also used in combination with an anti-inflammatory agent, to treat a

C chronic inflammation, especially rheumatoid arthritis, psoriasis and
